Cholera vaccination

Cholera vaccination may be considered to protect short-time travellers against traveller's diarrhoea caused by enterotoxin-producing E. Coli (ETEC), EPI-NEWS 44/98.

Special public authority requirements

Residence/transit in countries where yellow fever can occur, may require vaccination at a later stage of the journey, yellow fever map, EPI-NEWS 24/03. Meningococcus vaccination against group A+C+W135+Y is required on pilgrimage to Saudi Arabia, for children from three months of age, EPI-NEWS 46/03.

Malaria prophylaxis

The most important precaution consists of primary prevention of mosquito bites with repellent/-bednet/. Five different pharmacological prophylaxis regimes are discussed below:

Chloroquine is used in the event of low risk of falciparum malaria or high sensitivity to chloroquine. This remedy is tolerated by pregnant women and children.

Chloroquine+proguanil are used in the event of high risk of falciparum malaria with reduced sensitivity to chloroquine. These agents are tolerated by pregnant women and children.

Mefloquine is effective against P. falciparum strains resistant to other malaria remedies and is contraindicated in pregnant women, and pregnancy should be avoided in the first three months after taking mefloquine. Mefloquine should not be used prophylactically for children under 15 kg, or for people with epilepsy or previous neuro-psychiatric illness.

When mefloquine cannot be used because of the limitations mentioned above, doxycycline or Malarone can be used.

Doxycycline is efficacious against strains of P. falciparum with resistance to other anti-malarial agents.

Doxycycline is contraindicated for pregnant women and children under the age of twelve, EPI-NEWS 19/03.

A Hepatitis A
B: Hepatitis B
D Diphtheria
f: SSME/TBE

G: Yellow fever
J: Japanese encephalitis
M: Meningococcus A+C
M* Meningococcus A+C+W135+Y

r: Rabies
s: Tuberculosis
T: Typhoid fever
V Mosquito bite prophylaxis

Q Chloroquine
U: Chloroquine + proguanil
X: Meflo-
Z: Doxycycline/Malarone

Malarone is efficacious against strains of *P. falciparum* with resistance to other anti-malarial agents. As far as possible, Malarone should not be used in pregnancy and it cannot be recommended for breast-feeding women, EPI-NEWS 51/98 and 19-20/02.

Treatment of children, see EPI-NEWS 19-20/99 and 19/03.

Self-treatment of malaria

When residing for a longer period of time in risk areas, where medical assistance or medicine cannot be expected to be accessible, medicine can be dispensed for self-treatment. An agent which is not included in the prophylaxis should be chosen:

If chloroquine has been used, possibly in combination with proguanil, mefloquine or Malarone is recommended.

Quinine should only be used for self-treatment in exceptional cases, EPI-NEWS 19/03, if mefloquine is used for primary prophylaxis. In that case, Malarone can be taken.

An alternative is artemisinin, a new anti-malarial agent used for treatment in parts of Africa and Asia. The agent has not been registered in Denmark.

Halofantrine is available in many countries, but should not be used.

Travel medicine on the Internet
